

OUR COMMITMENT TO SAFETY

The proposed Constitution Pipeline is being designed with safety as its top priority.

We are adopting design features and operating practices that will exceed many already stringent industry and regulatory safety standards. Some of the measures will include:

- Automatic shut off valves with remote monitoring 24 hours a day
- Inspection of the integrity of 100% of the welds on the pipeline
- In certain areas, installing thicker steel pipe than is required by regulations
- More frequent inspections than are required by law, including regular inspections with highly-sophisticated internal inspection tools

For more information about our comprehensive safety program, visit us at: constitutionpipeline.com.

MEETING THE GROWING DEMAND FOR DOMESTIC CLEAN ENERGY

The developers of the Constitution Pipeline project are listening. One of the things we are often asked about is the need for the pipeline.

Historically low natural gas prices and the public's desire for cleaner energy have fueled the growing demand for natural gas. Clean-burning natural gas currently produces one-third of all electric generation and heats about half of all U.S. homes – and those numbers continue to climb.

Traditionally, most East Coast markets received shipments of natural gas via pipelines from the Gulf Coast and Western Canada. However, recent discoveries of abundant gas supplies in Pennsylvania have dramatically shifted the marketplace. Although this supply is close to major markets, the area currently lacks sufficient pipeline infrastructure to fully take advantage of the resource.

The Constitution Pipeline is being designed to change that, connecting Pennsylvania natural gas supply with pipelines that serve numerous power plants, municipalities, cities and industries in the northeastern United States.

PROTECTING THE ENVIRONMENT

The Constitution Pipeline is being designed to minimize environmental impacts.

During the analysis of potential pipeline routes, extra effort is being taken to identify sensitive areas of ecological or historic significance. Teams of field scientists, archaeologists and biologists have spent months conducting detailed environmental surveys and evaluations of potential study corridors, searching for:

- Threatened or endangered wildlife
- Sensitive habitats and vegetation
- Wetlands and water bodies
- Areas of archaeological significance

It's critical for project planners to have accurate, current information on the proposed pipeline route so that they can make sound, appropriate routing and construction recommendations. Constitution Pipeline will be working closely with federal, state and local permitting agencies to develop installation plans and mitigation techniques that result in avoiding or minimizing the effects of pipeline construction.

For more information about our environmental commitment, visit us at: constitutionpipeline.com.

OUR COMMITMENT TO YOU

The developers of the Constitution Pipeline project recognize the importance of treating the land, and landowners, with respect.

Before building a pipeline, we recognize how important it is to build a relationship of trust with landowners. That means operating with integrity and treating you, and your land, with respect. From project planning through construction and pipeline operation, we are committed to open communication, treating landowners fairly and keeping our promises.

If the pipeline project is ultimately constructed, an important part of that commitment will be restoring the land as closely as possible to its original condition. Our standard construction procedure includes photo-documenting the land before construction begins. Once we're finished, we will replace topsoil and re-grade to restore drainage patterns. In agricultural areas, we'll conduct follow up inspections after the first and second growing seasons to ensure your crops come back as strong as they were before.

For more information about construction restoration, visit us at: constitutionpipeline.com.
